

8th Annual Disease Management Colloquium

Retail-Based Healthcare Clinics: *Outcomes & Performance Measurement*

Jim Woodburn, MD, MS

Entrepreneur-in-Residence

Lemhi Ventures

May 20, 2008

Overview

- Outcome Measurement Principles
- System vs. Practitioner Measures
- Setting the Bar
- Q & A

Measurement Principles

- As a new setting for care, retail health care providers know that measurement is critical
- To demonstrate care results to:
 - patients,
 - the medical community,
 - regulators and
 - payers but,
- **ALL** providers should 'step up' and measure their clinical quality

Measurement Principles

- Vast & chaotic array of current measurement activities:
 - Pay-for-Performance projects
 - Bridges to Excellence
 - Leapfrog
 - CMS
- All struggling for reliable methods and uniform adoption

Measuring Quality of Care

3 Dimensions of quality of care

1. Patient satisfaction & experience
2. Access of care
 - scheduling availability, wait times, etc.
3. Patient **clinical** & functional outcome
 - Results to demonstrate effectiveness and safety

Convenient Care Association Measurement Principles

- All CCA Members are committed to monitoring quality on an ongoing basis, including but not limited to:
 - a) peer review;
 - b) collaborating physician review;
 - c) use of **evidence-based guidelines**;
 - d) **collecting aggregate data** on selected quality and safety outcomes;
 - e) collecting patient satisfaction data.

System vs. Practitioner level

- Both system-wide as well as individual practitioner measurements are helpful to understand the delivery of care
- **System results:** patient satisfaction, average wait times, generic medication prescribing rates, vaccine temperature control
- **Individual results:** complaints or commendations, rates of strep positive results, generic medication prescribing rate, proficiency testing

System Level Measures

- Examples of independent aggregators of data:

Heart Attack Graphs

Graph 1 of 8

- Percent of Heart Attack Patients Given ACE Inhibitor or ARB for Left Ventricular Systolic Dysfunction (LVSD)
The rates displayed in this graph are from data reported for discharges January 2006 through December 2006.

Top Hospitals represents the top 10% of hospitals nationwide. Top hospitals achieved a 100% rate or better.

Why is this Important?

ACE (angiotensin converting enzyme) inhibitors and ARBs (angiotensin receptor blockers) are medicines used to treat patients with heart failure and are particularly beneficial in those patients with heart failure and decreased function of the left side of the heart. Early treatment with ACE inhibitors and ARBs in patients who have heart failure symptoms or decreased heart function after a heart attack can also reduce

Clinical Outcome Measurement

- Goal of care:
 - Curing disease is the ideal clinical outcome,
 - But measuring **cure** is very complex
- Interim step:
 - Process measures
- **Assume**: Use of nationally established clinical practice guidelines improve care by:
 - optimizing effectiveness and
 - improving safety
- **Then**: Measure adherence to guidelines for care

Setting the bar

- *Quality of Care in the Retail Health Care Setting Using National Clinical Guidelines for Acute Pharyngitis*
- Authors: Woodburn, Smith, Nelson
- **American Journal of Medical Quality**, Vol. 22, No 6, Nov/Dec, 2007

Measuring Adherence to Clinical Guidelines

- Study Summary:
 - **ALL** patient records (n=57,331) reviewed for evaluation of acute pharyngitis
 - Sept. 2005 to Sept. 2006
 - MN and MD MinuteClinics (n=28 clinics)
 - **Guideline:** 1) All sore throats need a rapid strep test and treat if positive, 2) if negative, strep culture and treat if positive.

Results

- Overall Positive Rapid Strep Test (RST): 23.5% of all sore throats (n=13,471)
- 99.75% of positive RST given an antibiotic
- Patients with neg RST (n= 38,810) had follow up confirmatory testing with 8.74% positive and 96.2% given an antibiotic

Results

- **99.05%** (43,446) of patients with a negative RST, did **not** receive an antibiotic
- **.95%** (414) of negative RST patients received an antibiotic. 50% of these had other circumstances e.g. unable to get an RX if culture returned positive
- Compared to Lindner 2006 Arch Int Med article that **30%** of patients received ABX with negative RST in PCP offices

Results Overall

- 99.15% guideline adherence for both appropriate prescribing of antibiotic for positive RST **as well as** avoiding antibiotic prescribing for negative RST

The Real Potential...

- **“Near-Perfect Quality”** lives in the retail healthcare setting
- Continuous quality measurement and improvement is possible and relatively easy
- Set a new bar of clinical performance and expectation
- **How:** Electronic Medical Records, well trained and experienced practitioners, limited scope of service, consistent training and adherence to guidelines

... And Possible Perils

The need for measuring and reporting outcomes in the Retail Health Setting

- Pressure for achieve economic results leading to poor decisions
- Losing focus on continuous measurement of individual performance
- Allowing patients to dictate antibiotic in absence of clinical rationale
- Refrigerator temperature control variation leading to vaccine inactivation & patient illness years in the future
